## 1 Relationships between the modes of convergence

We ended last lecture with the statement of the following implications,

$$X_n \xrightarrow{a.s.} X \implies X_n \xrightarrow{p} X \implies X_n \xrightarrow{d} X,$$

and for any  $r > 0$ ,

$$X_n \xrightarrow{L^r} X \implies X_n \xrightarrow{p} X \implies X_n \xrightarrow{d} X.$$

None of the converse are true in generality, but today we will see some partial converses. Starting with the following,

**Proposition 1.** *Suppose that  $X_n \xrightarrow{p} X$ , then there exists a subsequence  $X_{n_k}$  such that  $X_{n_k} \xrightarrow{a.s.} X$  as  $k \rightarrow \infty$ .*

*Proof.* Suppose that  $X_n \xrightarrow{p} X$ . Then for every  $k \in \mathbb{N}$ , there exists  $n_k$  such that,

$$\mathbb{P}(\|X_{n_k} - X\| \geq 1/k) \leq 2^{-k}.$$

We may choose the integers  $n_k$  so that they are strictly increasing in  $k$ . We will now show that  $X_{n_k} \xrightarrow{a.s.} X$ . Let  $B$  be the set on which  $X_{n_k} \rightarrow X$ . Note that

$$A_m = \bigcap_{k=m}^{\infty} \{\|X_{n_k} - X\| < 1/k\} \subseteq B.$$

Furthermore,

$$\mathbb{P}(A_m^C) \leq \sum_{k=m}^{\infty} \mathbb{P}(\|X_{n_k} - X\| \geq 1/k) \leq \sum_{k=m}^{\infty} \frac{1}{2^k}.$$

Thus,  $\mathbb{P}(A_m^C) \rightarrow 0$  as  $m \rightarrow \infty$  and hence  $\mathbb{P}(A_m) \rightarrow 1$  as  $m \rightarrow \infty$ . Since  $\mathbb{P}(B) \geq \mathbb{P}(A_m)$  for every  $m$  we have  $\mathbb{P}(B) = 1$ .  $\square$

## 2 Scales of magnitude

Recall the following definitions for describing the asymptotic relationship between sequences of numbers.

**Definition 1.** Let  $\{a_n\}_{n \geq 1}$  and  $\{b_n\}_{n \geq 1}$  be sequences of constants. Then,

1.  $a_n = o(b_n)$  means that  $\frac{a_n}{b_n} \rightarrow 0$  as  $n \rightarrow \infty$ .
2.  $a_n = O(b_n)$  means that  $\limsup_{n \rightarrow \infty} \left| \frac{a_n}{b_n} \right| < \infty$ .
3.  $a_n \sim b_n$  means that  $\frac{a_n}{b_n} \rightarrow 1$  as  $n \rightarrow \infty$ .

These definitions all have probabilistic analogs for sequences of random variables.

**Definition 2.** Let  $\{X_n\}_{n \geq 1}$  be a sequence of random variables and let  $\{b_n\}_{n \geq 0}$  be a sequence of constants. Then,

1.  $X_n = o_p(b_n)$  means that  $\frac{X_n}{a_n} \xrightarrow{P} 0$  as  $n \rightarrow \infty$ .
2.  $X_n = O_p(1)$  means that
 
$$\lim_{K \rightarrow \infty} \sup_n \mathbb{P}(|X_n| \geq K) = 0.$$
3.  $X_n = O_p(b_n)$  means that  $\frac{X_n}{b_n} = O_p(1)$ .

The following arithmetic rules are useful and simple to prove.

**Lemma 1.** *We have*

$$\begin{aligned} o_p(1) + o_p(1) &= o_p(1) \\ O_p(1) + O_p(1) &= O_p(1) \\ O_p(a_n)O_p(b_n) &= O_p(a_nb_n) \\ O_p(a_n)o_p(b_n) &= o_p(a_nb_n). \end{aligned}$$

## 3 Inequalities for the $L^r$ space

We will now state and prove some important inequalities and facts about random variables in  $L^r$ .

**Proposition 2.** *If  $\mathbb{E}|X|^r < \infty$ , then  $\mathbb{E}|X|^{r'} < \infty$  for all  $r' \leq r$ .*

*Proof.* If  $r' \leq r$ , then  $|X|^{r'} \leq 1 + |X|^r$ . Thus, if  $\mathbb{E}|X|^r < \infty$ , then

$$\mathbb{E}|X|^{r'} \leq 1 + \mathbb{E}|X|^r < \infty \quad \square$$

**Proposition 3.** *For any random variable  $X$ ,  $\text{Var}(X) < \infty$  if and only if  $\mathbb{E}[X^2] < \infty$ .*

*Proof.* If  $\mathbb{E}[X^2] < \infty$ , then  $\mathbb{E}[X] \leq \mathbb{E}[|X|] < \infty$ . And thus

$$\text{Var}(X) = \mathbb{E}[X^2] - \mathbb{E}[X]^2 < \infty.$$

If  $\text{Var}(X) < \infty$ , then  $\mathbb{E}[(X - \mathbb{E}[X])^2] < \infty$  in particular  $\mathbb{E}[X] \in \mathbb{R}$ . Thus,  $\mathbb{E}[X^2] = \mathbb{E}[X]^2 + \text{Var}(X) < \infty$ .  $\square$

**Proposition 4.** *For every  $r > 0$ ,  $\mathbb{E}|X + Y|^r \leq c_r \mathbb{E}|X|^r + c_r \mathbb{E}|Y|^r$  where  $c_r = 1$  if  $0 < r \leq 1$  and  $c_r = 2^{r-1}$  for  $r \geq 1$ .*

*Proof.* First suppose that  $r > 1$ . The function  $f(x) = |x|^r$  is convex and thus,

$$\left| \frac{X+Y}{2} \right|^r \leq \frac{1}{2}|X|^r + \frac{1}{2}|Y|^r.$$

Thus,  $|X+Y|^r \leq 2^{r-1}|X|^r + 2^{r-1}|Y|^r$ .

Now suppose  $0 < r \leq 1$ . If  $|X+Y|^r \leq |X|^r$ , then we are done. If  $|X+Y|^r > |X|^r$ , then

$$\begin{aligned} |X+Y|^r - |X|^r &= \int_{|X|}^{|X+Y|} r t^{r-1} dt \\ &\leq \int_{|X|}^{|X|+|Y|} r t^{r-1} dt \\ &= \int_0^{|Y|} r(t+|X|)^{r-1} dt \\ &\leq \int_0^{|Y|} r t^{r-1} dt \\ &= |Y|^r. \end{aligned}$$

Thus,  $|X+Y|^r \leq |X|^r + |Y|^r$ . □

We next prove Hölder's inequality.

**Proposition 5.** Let  $r, s \geq 1$  be such that  $\frac{1}{r} + \frac{1}{s} = 1$ , then

$$\mathbb{E}|XY| \leq (\mathbb{E}|X|^r)^{1/r} \left( \mathbb{E}|Y|^s \right)^{1/s}.$$

*Proof.* If  $\mathbb{E}|X|^r = 0$  or  $\mathbb{E}|Y|^s = 0$ , then  $X = 0$  almost surely or  $Y = 0$  almost surely. Hence,  $XY = 0$  almost surely and thus  $\mathbb{E}|XY| = 0$ . Thus, we may assume  $\mathbb{E}|X|^r, \mathbb{E}|Y|^s > 0$ . If  $\mathbb{E}|X|^r = \infty$  or  $\mathbb{E}|Y|^s = \infty$ , then we are done. Thus, we will assume that  $\mathbb{E}|X|^r, \mathbb{E}|Y|^s \in (0, \infty)$ . We will first prove Young's inequality which states for all  $a, b \geq 0$ ,

$$ab \leq \frac{a^r}{r} + \frac{b^s}{s}.$$

Note that if  $a = 0$  or  $b = 0$ , then Young's inequality is an equality. Thus assume that  $a, b > 0$ . We know that the function  $x \mapsto e^x$  is convex. Since  $\frac{1}{r} + \frac{1}{s} = 1$ , we thus have

$$\begin{aligned} ab &= e^{\log(ab)} \\ &= e^{\log(a) + \log(b)} \\ &= e^{\frac{1}{r} \log(a^r) + \frac{1}{s} \log(b^s)} \\ &\leq \frac{1}{r} e^{\log(a^r)} + \frac{1}{s} e^{\log(b^s)} \\ &= \frac{a^r}{r} + \frac{b^s}{s}, \end{aligned}$$

as claimed. We will now apply Young's inequality point-wise to prove Hölder's inequality,

$$\begin{aligned}
 \frac{\mathbb{E}[|XY|]}{(\mathbb{E}|X|^r)^{1/r} (\mathbb{E}|Y|^s)^{1/s}} &= \int_{\Omega} \frac{|X||Y|}{(\mathbb{E}|X|^r)^{1/r} (\mathbb{E}|Y|^s)^{1/s}} d\mathbb{P} \\
 &\leq \int_{\Omega} \frac{1}{r} \frac{|X|^r}{\mathbb{E}|X|^r} + \frac{1}{s} \frac{|Y|^s}{\mathbb{E}|Y|^s} d\mathbb{P} \\
 &= \frac{1}{r\mathbb{E}|X|^r} \int_{\Omega} |X|^r d\mathbb{P} + \frac{1}{s\mathbb{E}|Y|^s} \int_{\Omega} |Y|^s d\mathbb{P} \\
 &= \frac{1}{r} + \frac{1}{s} \\
 &= 1.
 \end{aligned}$$

Thus  $\mathbb{E}|XY| \leq (\mathbb{E}|X|^r)^{1/r} (\mathbb{E}|Y|^s)^{1/s}$ . □

## 4 Convergence in distribution

The following theorem shows that we can study convergence in distribution of random vectors by projecting onto one dimensional subspaces.

**Theorem 1** (Cramér–Wold device). *Let  $X_n$  and  $X$  be random vectors in  $\mathbb{R}^d$ , then  $X_n \xrightarrow{d} X$  if and only if  $a^T X_n \xrightarrow{d} a^T X$  for all constants  $a \in \mathbb{R}^d$ .*

We also have a version of the continuous mapping theorem for convergence in distribution and almost sure convergence. The version for convergence in probability was stated in the first lecture.

**Theorem 2** (Continuous mapping theorem). *Let  $g$  be a continuous function on a set  $B$  such that  $\mathbb{P}(X \in B) = 1$ . Then*

1. *If  $X_n \xrightarrow{p} X$ , then  $g(X_n) \xrightarrow{p} g(X)$ .*
2. *If  $X_n \xrightarrow{d} X$ , then  $g(X_n) \xrightarrow{d} g(X)$ .*
3. *If  $X_n \xrightarrow{a.s.} X$ , then  $g(X_n) \xrightarrow{d} g(X)$ .*

We have already proved 1. For now, we will only prove 3. Once we have Skorokhod's theorem we will see that 3 implies 2.

*Proof.* Let  $A$  be the set on which  $X_n \rightarrow X$ . Since  $g$  is continuous on  $B$ , we have  $g(X_n) \rightarrow g(X)$  on  $A \cap B$ . Since  $A$  and  $B$  both have probability 1,  $\mathbb{P}(A \cap B) = 1$  and thus  $\mathbb{P}(g(X_n) \rightarrow g(X)) = 1$ . □

**Definition 3.** Given a cumulative distribution function  $F$  on  $\mathbb{R}$ , define  $F^{-1} : (0, 1) \rightarrow \mathbb{R}$  to be the function

$$F^{-1}(t) = \inf\{x : F(x) \geq t\}.$$

The function  $F^{-1}$  is called the *quantile function* of  $F$ .

**Proposition 6.** *The function  $F^{-1}$  is non-decreasing and left-continuous. And for all  $t \in (0, 1)$  and  $x \in \mathbb{R}$ ,*

$$F^{-1}(t) \leq x \iff t \leq F(x).$$

*Proof.* The set  $\{x : F(x) \geq t\}$  are non-increasing with  $t$  and thus if  $t \leq t'$ , then

$$F^{-1}(t) = \inf\{x : F(x) \geq t\} \leq \inf\{x : F(x) \geq t'\} = F^{-1}(t').$$

Showing that  $F^{-1}$  is non-increasing. Continuity can be proved by considered first the points  $t$  such that  $F$  is continuous at  $F^{-1}(t)$  and then the points  $t$  where  $F$  is discontinuous at  $F^{-1}(t)$ . A picture helps.

Finally, if  $F^{-1}(t) \leq x$ , then  $\inf\{z : F(z) \geq t\} \leq x$ . Thus, for any  $\varepsilon > 0$ , there exists  $z < x + \varepsilon$  such that  $F(z) \geq t$ . Since  $F$  is right-continuous, this implies that

$$F(x) = \lim_{z \searrow x} F(z) \geq t.$$

Conversely, if  $t \leq F(x)$ , then  $x \in \{z : F(z) \geq t\}$  and so  $F^{-1}(t) \leq x$ . □

The function  $F^{-1}$  also have the following properties.

**Proposition 7.** Let  $X$  be random variable with CDF  $F$ . Then for all  $t \in (0, 1)$ ,

$$\mathbb{P}(F(X) \leq t) \leq t,$$

and we have equality if and only if  $t$  is in the range of  $F$ . In particular if  $F$  is continuous, then the above holds for all  $t \in (0, 1)$  and thus  $F(X) \sim U(0, 1)$ . We can also write the above inequality as for all  $t \in (0, 1)$

$$F(F^{-1}(t)) \geq t.$$

We also have  $F^{-1}(F(x)) \leq x$  for all  $x \in \mathbb{R}$  with strict inequality if and only if  $F(x - \varepsilon) = F(x)$  for some  $\varepsilon > 0$ . Thus,  $\mathbb{P}(F^{-1}(F(X)) \neq X) = 0$ .

We also have

**Proposition 8.** Let  $U \sim U(0, 1)$  and let  $F$  be some CDF function. Let  $X = F^{-1}(U)$ . Then  $\{X \leq x\} = \{U \leq F(x)\}$  and so  $X \sim F$ .

We will now state and prove Skorokhod's representation theorem.

**Theorem 3.** Suppose that  $X_n \xrightarrow{d} X$ , then there exist random variables  $X_n^*$  and  $X^*$  such that  $X_n^* \xrightarrow{a.s.} X^*$ ,  $X_n^* \stackrel{\text{dist}}{=} X_n$  and  $X^* \stackrel{\text{dist}}{=} X$ .

*Proof.* Let  $F_n$  be the CDF of  $X_n$  and let  $F$  be the CDF of  $X$ . Define  $X_n^* = F_n^{-1}(U)$  and  $X^* = F^{-1}(U)$ . We will show that for all but a countable number of  $t \in (0, 1)$  we have  $F_n^{-1}(t) \rightarrow F^{-1}(t)$ . This will imply that  $X_n^* \rightarrow X^*$  with probability 1.

Since  $F^{-1}$  is increasing,  $F^{-1}$  has at most countably many discontinuities. Let  $t \in (0, 1)$  be a point such that  $F^{-1}$  is continuous at  $t$  and let  $\varepsilon > 0$ . We can find a value  $x$  such that  $F$  is continuous at  $x$  and

$$F^{-1}(t) - \varepsilon < x < F^{-1}(t).$$

It follows that  $F(x) < t$ . Since  $F$  is continuous at  $x$  we know that  $F_n(x) \rightarrow F(x)$ . Thus, for large enough  $n$ ,  $F_n(x) < t$  which implies  $x \leq F_n^{-1}(t)$  and so

$$\liminf_n F_n^{-1}(t) \geq x \geq F^{-1}(t) - \varepsilon.$$

Which implies  $\liminf_n F_n^{-1}(t) \geq F^{-1}(t)$ . Now consider  $s > t$  and choose  $y$  such that  $F^{-1}(s) < y < F^{-1}(s) + \varepsilon$  and  $F$  is continuous at  $y$ . Thus,  $t < s \leq F(y)$ . Thus, for large enough  $n$ ,  $t < F_n(y)$  which implies  $F_n^{-1}(t) \leq y \leq F^{-1}(s) + \varepsilon$ . This implies that

$$\limsup_n F_n^{-1}(t) \leq F^{-1}(s) + \varepsilon,$$

for all  $s > t$  and  $\varepsilon > 0$  since  $F^{-1}$  is continuous at  $t$  this implies that

$$\limsup_n F_n^{-1}(t) \leq F^{-1}(t).$$

Thus,  $F_n^{-1}(t) \rightarrow F^{-1}(t)$  as required.  $\square$

As a corollary of Skorokhod's theorem we can prove the continuous mapping theorem for convergence in distribution.

**Corollary 1.** *Suppose that  $X_n \xrightarrow{d} X$  and  $g$  is continuous on a set  $B$  with  $\mathbb{P}(X_0 \in B) = 1$ , then  $g(X_n) \xrightarrow{d} g(X)$*

*Proof.* Let  $X_n^*$  and  $X^*$  be as in Skorokhod's theorem. Then  $g(X_n^*) \xrightarrow{a.s.} g(X^*)$  by the continuous mapping theorem for almost sure convergence. Thus,  $g(X_n^*) \xrightarrow{d} g(X^*)$ . But  $g(X_n^*) \stackrel{\text{dist}}{=} g(X_n)$  and  $g(X^*) \stackrel{\text{dist}}{=} g(X)$  and thus  $g(X_n) \xrightarrow{d} g(X)$ .  $\square$
